I build *mobile SDKs* and the platforms behind them.

I'm **Ramlal Suthar**, an early engineer at **Digia**, which I joined pre-product in 2023. I work full-stack: SDKs in Flutter, Android, iOS and React Native, plus the Go and Node.js services, React dashboard and analytics behind them. Right now that's **Digia Engage**, in-app campaigns that marketers design in a dashboard and that render natively in customer apps.

EXPERIENCE

Platform, SDK & Infrastructure

• Current

Early Engineer

full-time | aug 2023 — present

Digia Engage in-app engagement SDK · feb 2026 — present

- Work on the **Flutter, Android, iOS and React Native SDKs** that render dashboard-designed campaigns (nudges, surveys, product guides, PiP, inline stories) natively in customer apps. Built the in-app survey and product-guide experiences.
- **Campaign delivery analytics, end to end:** SDK events with drop reasons, a ClickHouse query behind a new analytics endpoint, and a dashboard panel showing how many campaigns were triggered, shown or dropped, broken down by cause (frequency cap, blocked by another campaign).
- **SDK compatibility checks:** the dashboard works out each campaign's minimum SDK version from a declarative capability registry and warns before a live change, and the backend filters the campaigns it sends by SDK version.
- Built the **MoEngage and WebEngage integrations** and contributed to CleverTap, so customers can trigger Digia campaigns from the engagement platform they already use. The tricky part was suppressing the platform's own in-app message for the same campaign so users don't see it twice.
- Started the **React Native SDK**: a native bridge over the Android and iOS SDKs for both the Old and New Architecture.
- **Testing across platforms:** wrote unit tests in each core SDK (Android, iOS, Flutter) alongside **Maestro end-to-end flows** in the shared test kit, which runs the same campaigns on every platform and compares golden snapshots.

Digia UI & Studio server-driven UI platform · aug 2023 — feb 2026

- Contributed to the **Digia UI SDK for Flutter**, which renders native UI from JSON so teams ship UI changes without an app release, cutting feature delivery time by about **60–70%**.
- Built the **Android Jetpack Compose SDK** from scratch, with the first version in 2 weeks: layout engine, modifiers, styling, actions, navigation and state.

- Built a React Native prototype SDK in a week to test server-driven UI on React Native, and developed **50+ components** for the shared, versioned component library.
- Worked on real-time preview of dashboard changes on a device, which shrank the feedback loop from days to minutes, and managed releases of the Preview Android app.
- Contributed Go and Node.js services for schema versioning and runtime config delivery, plus Jenkins CI/CD.

Digia
Client apps for a local business

Mobile App Developer Intern

internship · may 2023 — jul 2023

- Built and launched **2 production Flutter apps** end-to-end, both published on Google Play.
- Implemented JSON-driven UI so the backend could change screens without an app release, the idea that later became Digia UI.
- Integrated Firebase Auth, Firestore and AWS services.

PROJECTS

LIVE

AnswerRank ↗

AEO diagnostic · LLM recommendation tracking

Checks how often a product gets recommended when Claude and Gemini are asked real buyer questions. It asks each model for its top 5 picks, normalises the answers, and reports where the product shows up against competitors and which criteria the models cite. Answers are cached for 12 hours to keep API cost down.

`claude api` `gemini api` `llm` `caching`

TradeSense AI ↗

Trading behaviour analysis

Analyses a trader's history to find habits that cost money, such as exiting winners early or overtrading. A Go backend computes win rate, risk-reward, holding time and MFE/MAE per trade, and K-means clustering groups traders by behaviour. An LLM turns the findings into plain-language coaching.

`go` `scikit-learn` `k-means` `llm` `docker`

UGen ↗

AI portfolio platform

A portfolio site where visitors can ask an AI about the owner's resume. I built the Go services: JWT auth, profiles, and a pipeline that parses an uploaded PDF resume, embeds it in Qdrant and answers questions with retrieval-augmented generation. Profiles live in MongoDB, behind a rate-limited gateway.

`go` `rag` `qdrant` `mongodb` `jwt`

Unigets

D2C / affiliate commerce

A storefront for trending products sold through Instagram ad funnels and partner sites. Built product discovery, redirect flows and basic conversion tracking in Node.js, so new landing pages could be tested quickly.

`node.js` `javascript`
